

The PEnGUIn Encoder MP4 adds subtitle support finally. In order to make subtitle be displayed in the output MP4 files, users have to set correct font and language code in preferences. And the most important is that users also have to put the subtitle with the same name (except extension) in the same place with video file.

have to set correct font and language code in preferences.

have to put the subtitle with the same name (except extension) in the same place with video file.

If Asian fonts can't be displayed correctly, users may need to remove the path:

```
sudo rm -r /usr/local/share/mplayer/fonts
```
