Ghostpress

Bulletproof anti-keylogger

Features

Ghostpress is an anti-keylogging software that prevent malicious software from capturing your keyboard presses.

Global protection

Full system wide protection and not limited to specific programs.

Process protection

Ghostpress prevents being closed from non-administrators and third party settings changes.

Delay protection

This optional feature allows spoofing your typing style in order to overcome supervision.

Portable program

Our program does not require an installation and administrator privileges are optional.

Low-level layer

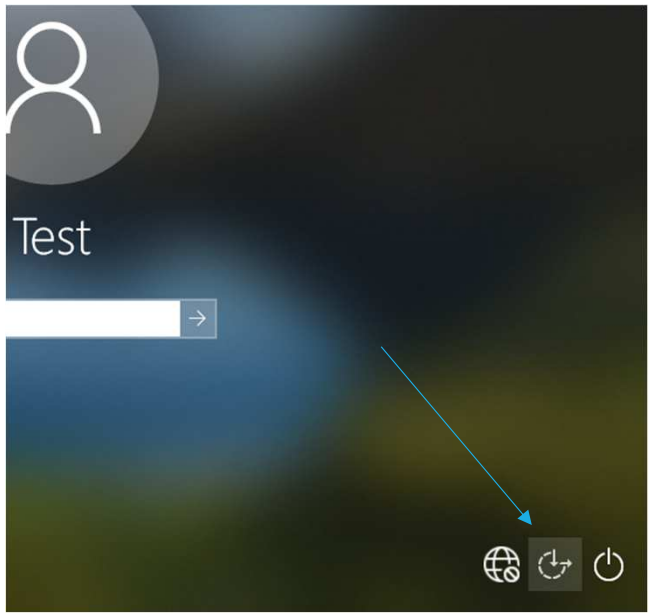
Ghostpress protects your key presses from inside of your system.

Winlogon support

By enabling this feature you will be able to launch Ghostpress in all Winlogon sessions.
This feature requires Windows 8 or newer.

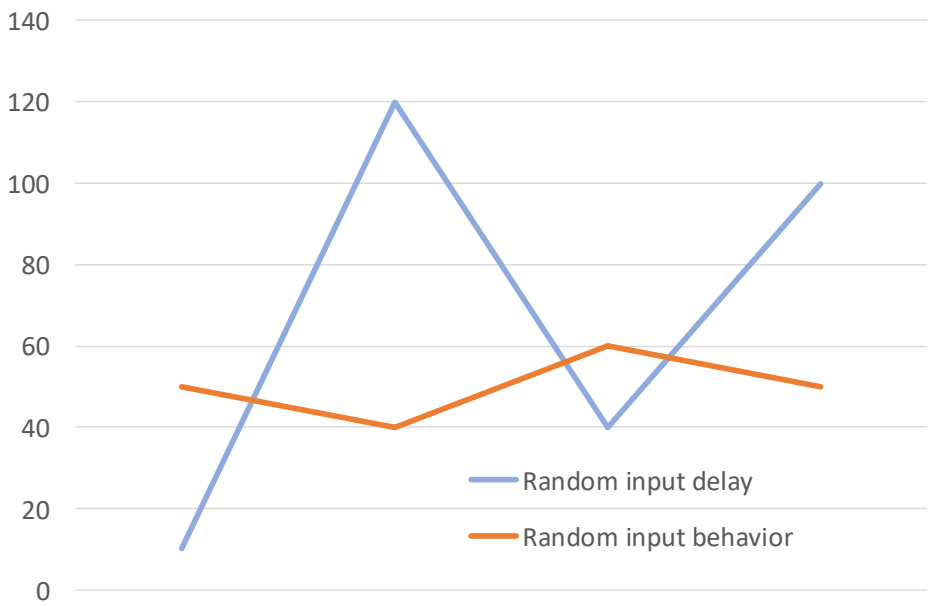
Click & go

Simply click “Ease of access”
Your first click launches Ghostpress and all further ones will act as usual.



Delay protection

Example delay for pressing the same button



1

What is delay protection?

This features literally delays the key events for a specific time in order to prevent supervision by the way you type.

2

When do I need delay protection?

This optional feature is made for people who want to ensure that the typing behavior is not the same in order to get identified. Otherwise we do not recommend to enable this feature.

3

What is random input delay?

This setting delays each key event for a specific random time. There will never be a same pattern or a same delay between two key events unless it is randomized that way.

4

What is random input behavior?

This setting uses two random parameters. First of all a smaller random value like “random input delay” and another generated value for the current key. The generated value is safely generated by a cryptographic number generator and stored until Ghostpress restarts. This spoofs a specific typing behavior temporary.

Command line

For an invidual use of Ghostpress you can use optional start parameters.

Autostart mode

Unless closed with disabled protection Ghostpress will start with Windows via “-autostart” with hidden UI and, if enabled, visible widget.

Ghost mode (commercial)

This mode starts Ghostpress without UI or visible options, just enabled protection. This option is aware of previous settings. Recommended for: Automation. Simply start Ghostpress with following argument “-ghost”

Hidden features

You can edit Ghostpress.ini and enable optional features which may not be fully tested or cause problems. Do not change any undocumented variables!

1

Protect more keys

ForceProtection_Tab=1

ForceProtection_Enter=1

2

Disable print key

ForceBlock_Print=1

3

Delay unprotected keys as well

ForceDelay_All_Keys=1

4
