

QuickStart Guide

Overall the application is simple. When it opens you will see the application as shown to the right. The interface is fairly simple; clicking file will present the options to use (open, save as, and exit). The buttons and menu items that are disabled remain so until a valid file is read in. All errors/output are reported in the text area. Once a valid file is read in you can run it by entering input in the input text field and clicking either go or step.

Once the input has been read through and either rejected or accepted the simulation is done; you can press reset to start over. Dump outputs the description of the machine to the text area. Choosing save as allows you to output the file to a txt file to be read in later. The image on the left shows the machine after reading an accepted input string. The next image on the left shows a failed input string sequence.
